WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or more, except for certain cases carded for record only (chiefly venereal disease cases which are treated on a duty status, and deaths which occurred before being "admitted" to hospital or quarters). Admissions designated as "injury" comprise all traumatism (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications). All other cases are classified as "disease", bearing in mind that under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties.

Admissions rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), total beds occupied and beds "available vacant".

Unless otherwise specified, normal bed capacity in this report is defined in Par. 36b (1) and (2) of AR40-1080, 10 December 1943, and Par. 14 WD Circular 43, 1 February 1944. This includes the T/O capacity of non-fixed hospitals but excludes convalescent facilities. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

The number of beds "available vacant" is defined as 80% of the total capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. The bed capacity and beds occupied in convalescent facilities are also indicated. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

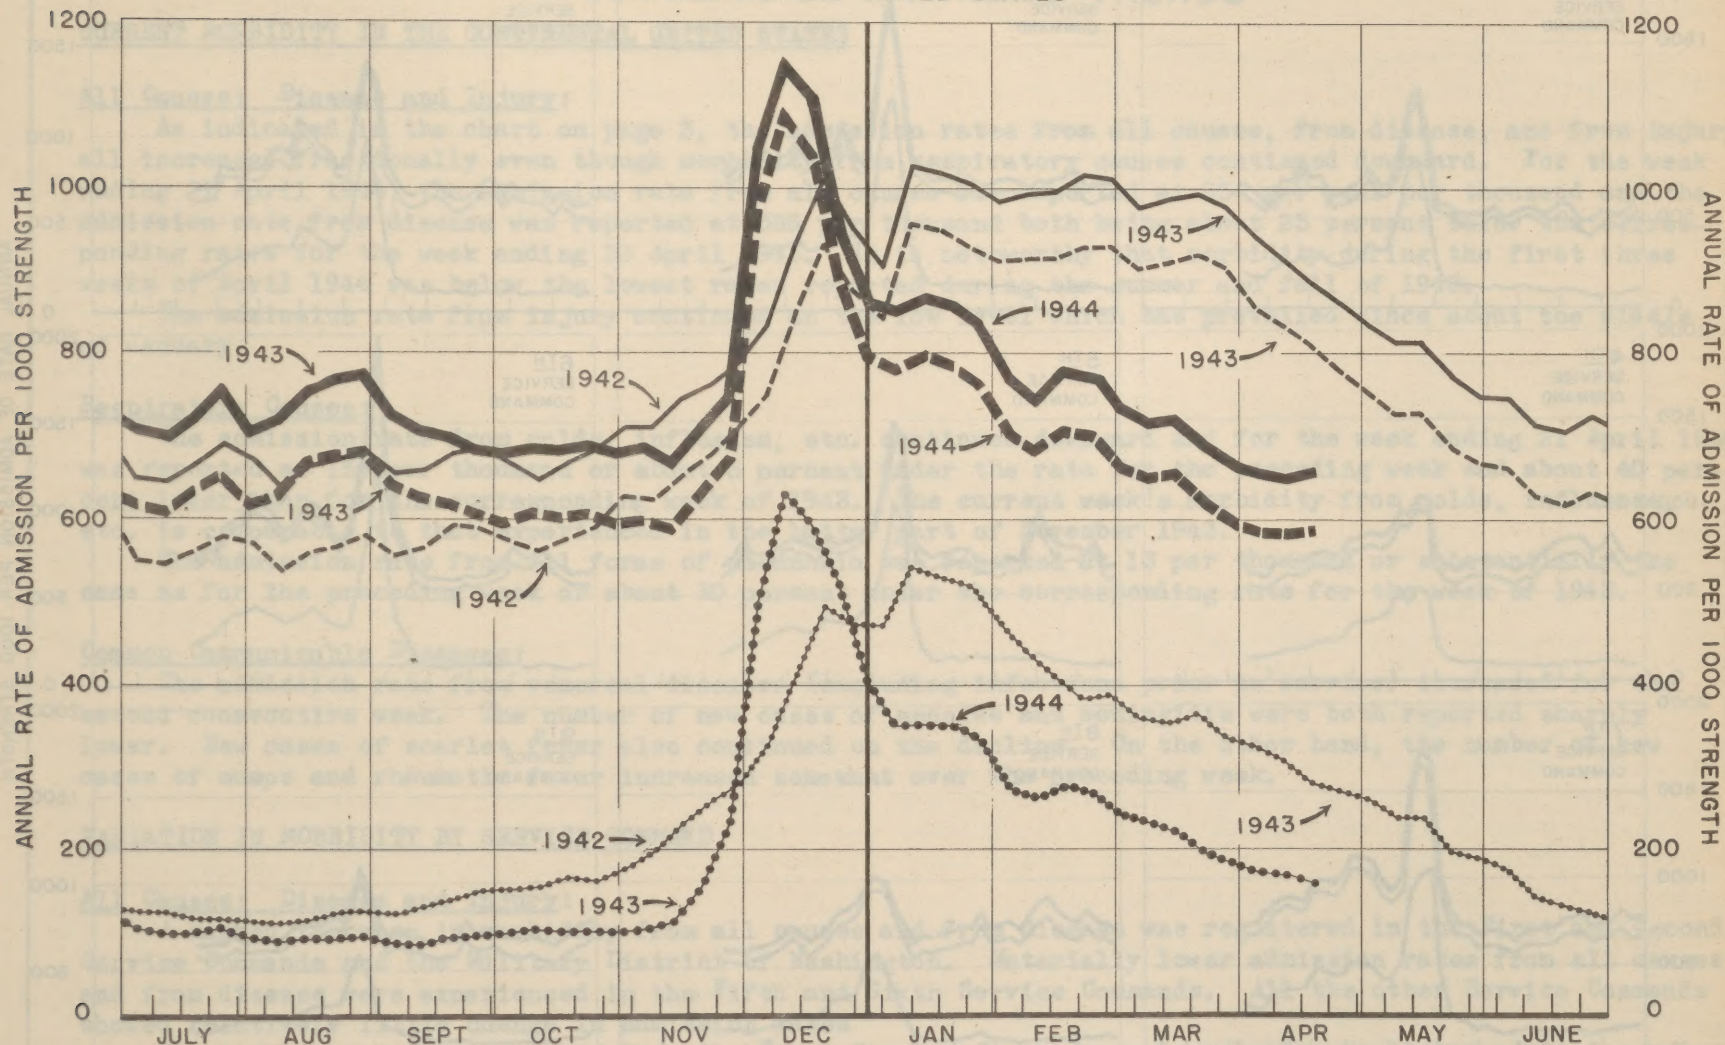

Where the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 21 APRIL 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

As indicated in the chart on page 3, the admission rates from all causes, from disease, and from injury all increased fractionally even though morbidity from respiratory causes continued downward. For the week ending 21 April 1944, the admission rate from all causes was reported at 654 per year per thousand and the admission rate from disease was reported at 586 per thousand both being about 25 percent below the corresponding rates for the week ending 23 April 1943. It is noteworthy that morbidity during the first three weeks of April 1944 was below the lowest rates reported during the summer and fall of 1943.

The admission rate from injury continued on the low level which has prevailed since about the middle of January.

Respiratory Causes:

The admission rate from colds, influenza, etc. continued downward and for the week ending 21 April 1944 was reported at 158 per thousand or about 5 percent under the rate for the preceding week and about 40 percent lower than for the corresponding week of 1943. The current week's morbidity from colds, influenza, etc. is comparable to that experienced in the latter part of November 1943.

The admission rate from all forms of pneumonia was reported at 13 per thousand or substantially the same as for the preceding week or about 30 percent under the corresponding rate for the week of 1943.

Common Communicable Diseases:

The admission rate from venereal diseases (excluding infections prior to service) increased for the second consecutive week. The number of new cases of measles and meningitis were both reported sharply lower. New cases of scarlet fever also continued on the decline. On the other hand, the number of new cases of mumps and rheumatic fever increased somewhat over the preceding week.

VARIATION IN MORBIDITY BY SERVICE COMMAND

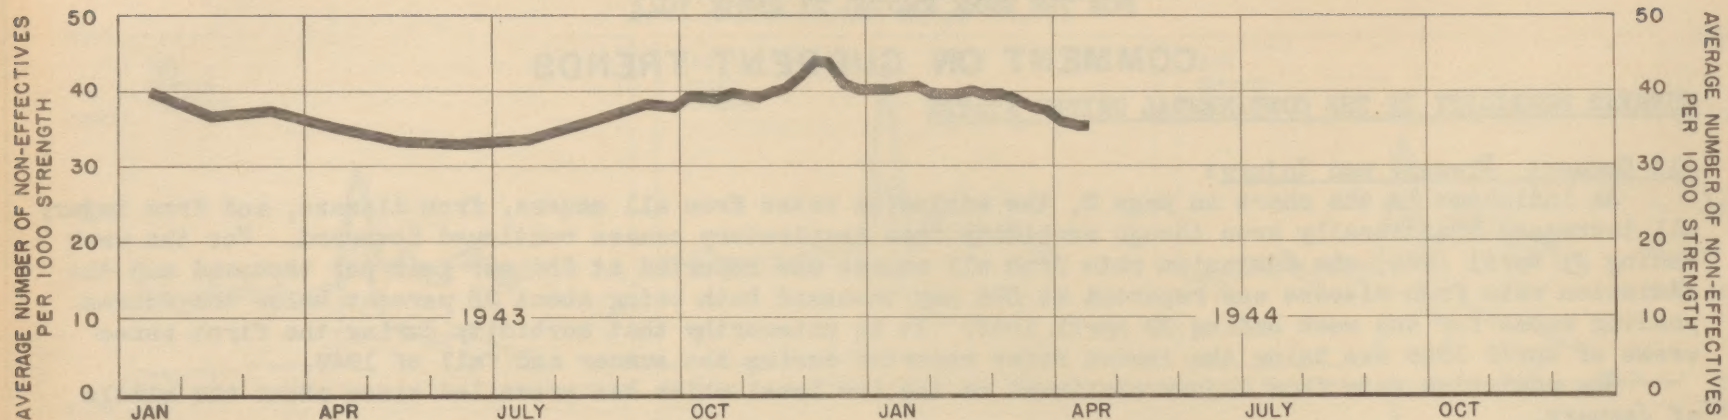

All Causes: Disease and Injury:

A marked increase in morbidity from all causes and from disease was registered in the First and Second Service Commands and the Military District of Washington. Materially lower admission rates from all causes and from disease were experienced in the Fifth and Sixth Service Commands. All the other Service Commands showed relatively little change in admission rates.

The higher morbidity reported from the First Service Command was largely due to higher admission rates from colds, influenza, etc. The higher morbidity experienced in the Second Service Command reflected in

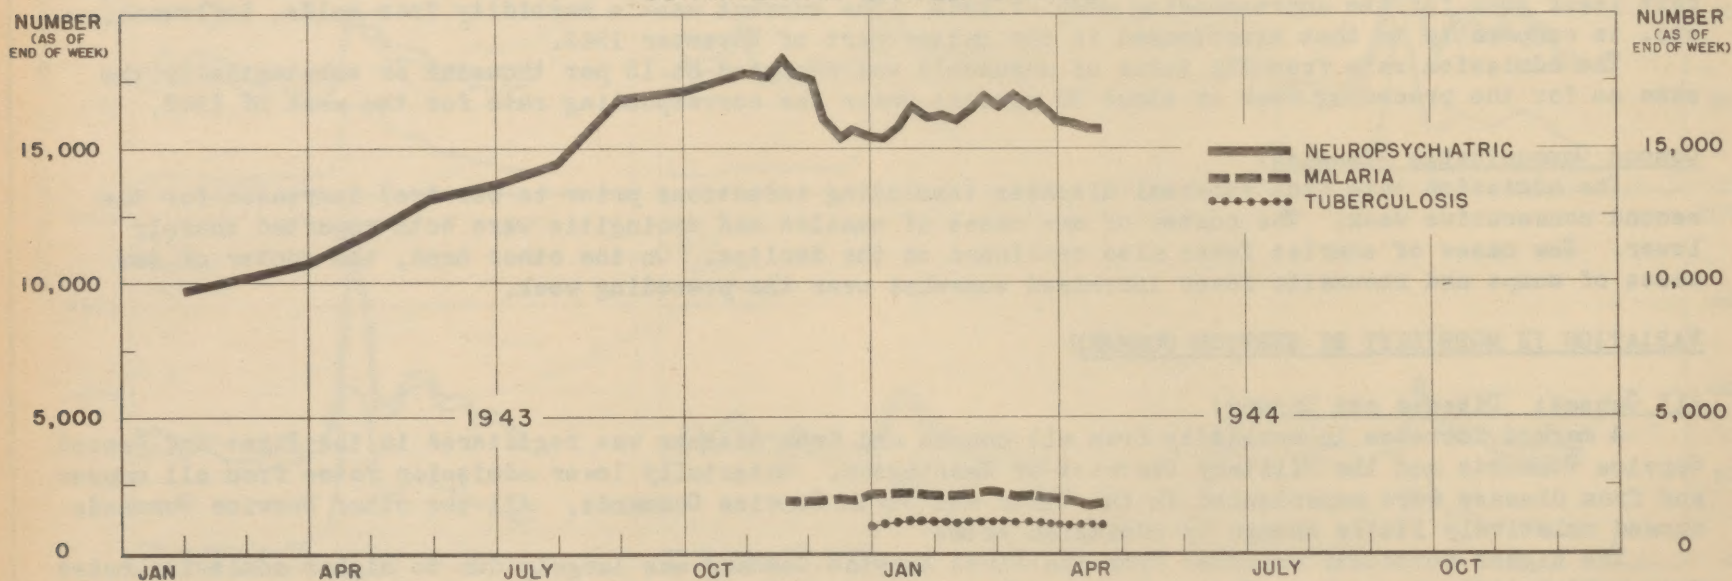

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 21 APRIL 1944

COMMENT ON CURRENT TRENDS (CONT'D)

part 132 cases of food poisoning at the Atlantic City Redistribution Center, A.A.F. The lower morbidity reported from the Fifth and Sixth Service Commands was due chiefly to lower admission rates from colds, influenza, etc.

The highest morbidity from all causes (854 per thousand) and from disease (791 per thousand) was registered in the Second Service Command. The Eighth Service Command continued to experience the lowest morbidity from all causes (599 per thousand) and from disease (532 per thousand).

Marked increases in the admission rate from injuries were reported from the Third and Fifth Service Commands with the result that the Third Service Command showed the highest morbidity from injury (75 per thousand) during the week ending 21 April 1944.

Respiratory Causes:

All the Service Commands except the First and Seventh reported lower morbidity from colds, influenza, etc. The largest decrease in the admission rate from these causes was registered in the Fifth and Sixth Service Commands. As a result, the Seventh Service Command displaced the Sixth Service Command reporting the highest admission rate from colds, influenza, etc. (273 per thousand). The lowest admission rate was again reported by the Fourth Service Command.

The Seventh Service Command, although reporting a 10 percent increase in morbidity from colds, influenza, etc. showed a sharp drop in the admissions from pneumonia.

Common Communicable Diseases:

Markedly higher morbidity from venereal diseases was reported from the Sixth, Ninth, and Fifth Service Commands. As a result, the Fifth Service Command displaced the Second Service Command, as the Command showing the highest morbidity from these causes (42 per thousand).

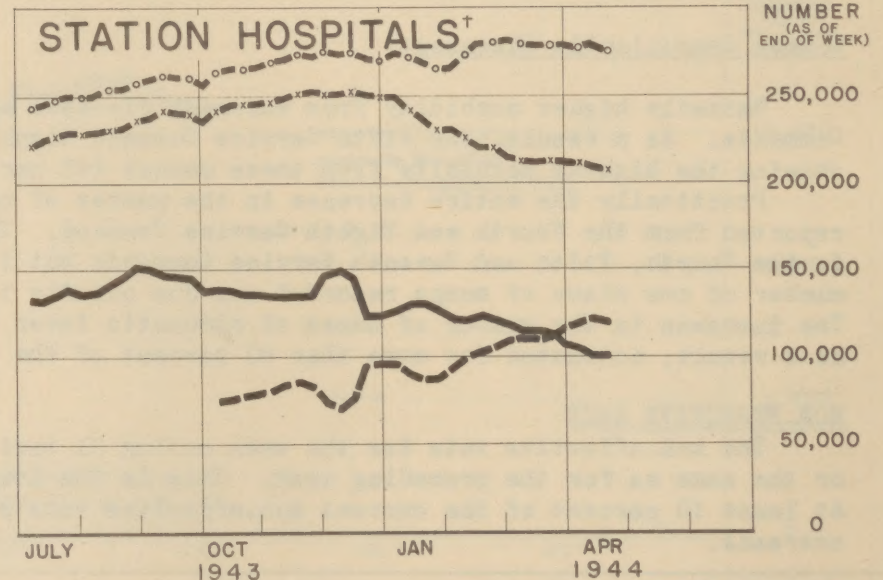

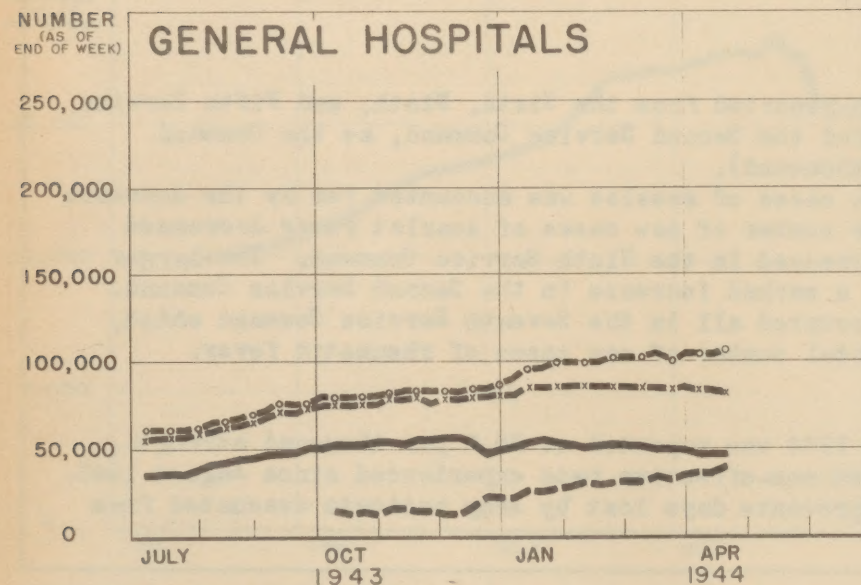

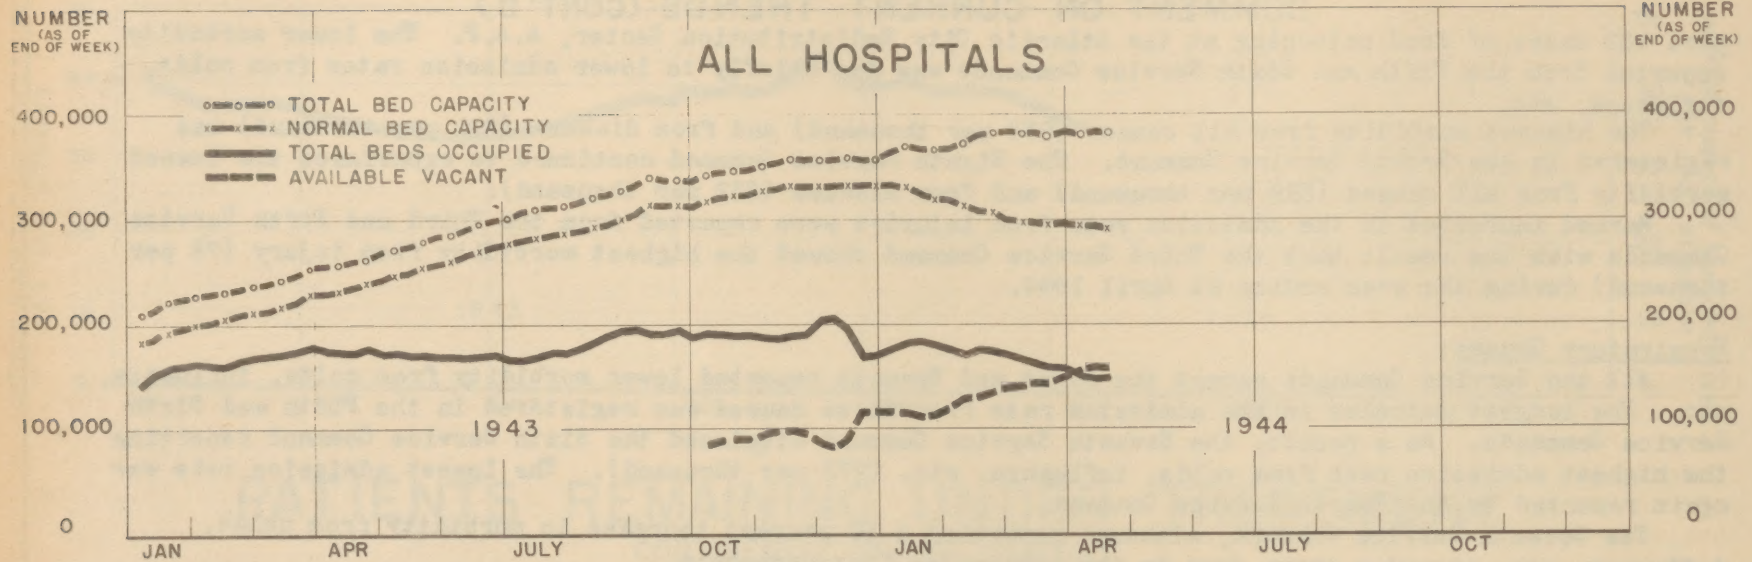

Practically the entire decrease in the number of new cases of measles was accounted for by the decrease reported from the Fourth and Eighth Service Command. The number of new cases of scarlet fever decreased in the Fourth, Fifth and Seventh Service Commands but increased in the Ninth Service Command. The larger number of new cases of mumps reported was due chiefly to a marked increase in the Second Service Command. The increase in the number of cases of rheumatic fever occurred all in the Seventh Service Command which, as a result, accounted for more than 40 percent of the total number of new cases of rheumatic fever.

NON-EFFECTIVE RATE

The non-effective rate for the week ending 21 April 1944 was reported at 35.7 per thousand strength, or the same as for the preceding week. This is the lowest non-effective rate experienced since August 1943. At least 10 percent of the current non-effective rate represents days lost by Army patients evacuated from overseas.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 21 APRIL 1944

COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week continued at about 35 per thousand strength. Thus far in 1944 the number of neuropsychiatric cases remaining has fluctuated in the range from 15,300 to 17,000 and for the week ending 21 April 1944 was reported at 15,700. The number of malaria cases under treatment has declined in recent weeks from a high of 2,230 on 25 February to 1,836 on 21 April 1944; only 30 of the 1,836 malaria cases presumably were acquired in the United States. The number of tuberculosis cases remaining under treatment was reported at 1,059 as of 21 April 1944.

CURRENT HOSPITAL CONDITIONS:

The total bed capacity as of 21 April 1944 was reported at about 381,000 or about 1,000 less than at the end of the previous week. The number of beds occupied decreased to 148,000 or 500 less than at the end of the preceding week, while the number of "available vacant" beds decreased to almost 157,000. Total beds occupied represented 39 percent of total bed capacity. There were 7 stations with bed capacity of about 4,000 having no "available vacant" beds; one General Hospital with a bed capacity of about 1,000 was included among them.

The number of normal beds decreased by about 3,000 and as of 21 April 1944 was reported at about 290,500 or 76 percent of the total bed capacity. Included in the normal bed capacity on 21 April 1944 were 8,328 T/O hospital beds and tentage, mostly in maneuver areas, while the total bed capacity included 8,994 such beds, of which 1,055 were occupied.

The total bed capacity of General Hospitals, which has shown a steady increase in recent months, was reported at about 106,000 as of 21 April 1944. On the same date about 47,000 of these beds (or 44 percent) were occupied. The "available vacant" beds at General Hospitals numbered 38,000 as of 21 April 1944. Normal beds at General Hospitals have been maintained at a level of about 85,000 since the beginning of the year.

The total bed capacity of Station Hospitals (including the relatively small number of beds in maneuver areas mentioned above) has remained practically level since the beginning of the year at about 275,000 beds, while the normal beds in these hospitals declined sharply from 250,000 as of 7 January 1944 to 207,000 as of 21 April 1944. Total beds occupied as of 21 April 1944 numbered 101,000 or about 35 percent of the corresponding total bed capacity. Station Hospitals had 119,000 "available vacant" beds as of 21 April 1944, next to the highest number yet reported.

As of 21 April 1944 the bed capacity of convalescent facilities in General Hospitals numbered 10,622 beds of which 4,129 beds, or 40 percent, were occupied.

SUPPLEMENTARY HEALTH REPORT

FOR THE FIVE WEEK PERIOD ENDING 31 MARCH 1944

NATURE OF THE DATA

The data of this Supplementary Report, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. However, unlike the Weekly Health Reports which are compiled on the basis of the figures as received, so as to place the information in circulation at the earliest possible time, the figures here presented for the five week period ending 31 March 1944 include the great majority of the corrected reports as well as reports received too late to be incorporated in the Weekly Health Report.

Hereafter, the term "month" will be used to denote the four or five week period based on the number of Fridays in the calendar month.

This Supplementary Report covers morbidity data for all individual stations with a strength of 1000 or over and gives details for admissions from venereal disease and for neuropsychiatric cases. Neuropsychiatric admissions are now shown for the first time classified as between psychiatric and organic neurological (rather than as between locked and open ward cases as had been done during 1943); the change from the previous Form 86ab to the new Form 86ab rendered such information unavailable for all stations for the first two months of 1944.

Charts showing morbidity trends from all causes, from all diseases combined, from injury, and from colds, influenza, etc. are presented on page 35. Similar charts for specified diseases appear on pages 37, 39, and 41. A chart showing mortality trends is presented on page 43. A summary for the month of the number of admissions and corresponding morbidity rates and of the number of deaths and corresponding mortality rates for the United States as a whole and for the Service Commands is given on page 46, while on pages 44 and 45 there is a cumulative summary for the year to date for both 1943 and 1944. The most pertinent morbidity data for individual stations are presented on pages 47 to 75. On pages 76 and 77 the six stations with the highest rates of admission during the month are shown for each of the morbidity categories considered.

In reading the detailed tables, it should be borne in mind that morbidity (or mortality) rates based on small numbers of cases are not reliable. For this reason the symbol "?" has been placed after rates computed on the basis of 5 or fewer cases. Attention is directed to the definitions of admissions and admission rates as given on page 2 of this Report.

SUPPLEMENTARY HEALTH REPORT

FOR THE FIVE WEEK PERIOD ENDING 31 MARCH 1944

COMMENT ON RECENT DEVELOPMENTS

MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY

During March, morbidity from all causes and from disease was about 10 percent lower than during February. The annual admission rate from all causes for the month was reported at 703 per year per thousand strength or almost 30 percent below that for March 1943. Almost the entire decrease from February to March 1944 in the admission rate for disease was accounted for by lower morbidity from colds, influenza, etc. During the first three months of 1944 morbidity from all causes and from disease decreased steadily unlike 1943 when a relatively high level (of about 1000 per thousand) persisted until April. As a result, morbidity for the first quarter of the year was about 20 percent lower in 1944 than in 1943.

The admission rate for injury remained on the same low level as during January and February (68 per thousand). For the first three months of 1944 morbidity from injury was about 10 percent under the rate recorded for the corresponding period of 1943.

Lower morbidity during March as compared with February was reported in every Service Command except the Fifth, which showed a small increase. In general, the largest decreases in admission rates from all causes and from disease occurred in the Service Commands which experienced the largest declines in morbidity from colds, influenza, etc. The Sixth Service Command reported the highest admission rates from all causes and from disease - about 33 percent higher than for the country as a whole. The lowest admission rates from all causes and from disease - about 12 percent below those for the United States as a whole - were registered in the Eighth Service Command.

RESPIRATORY DISEASES:

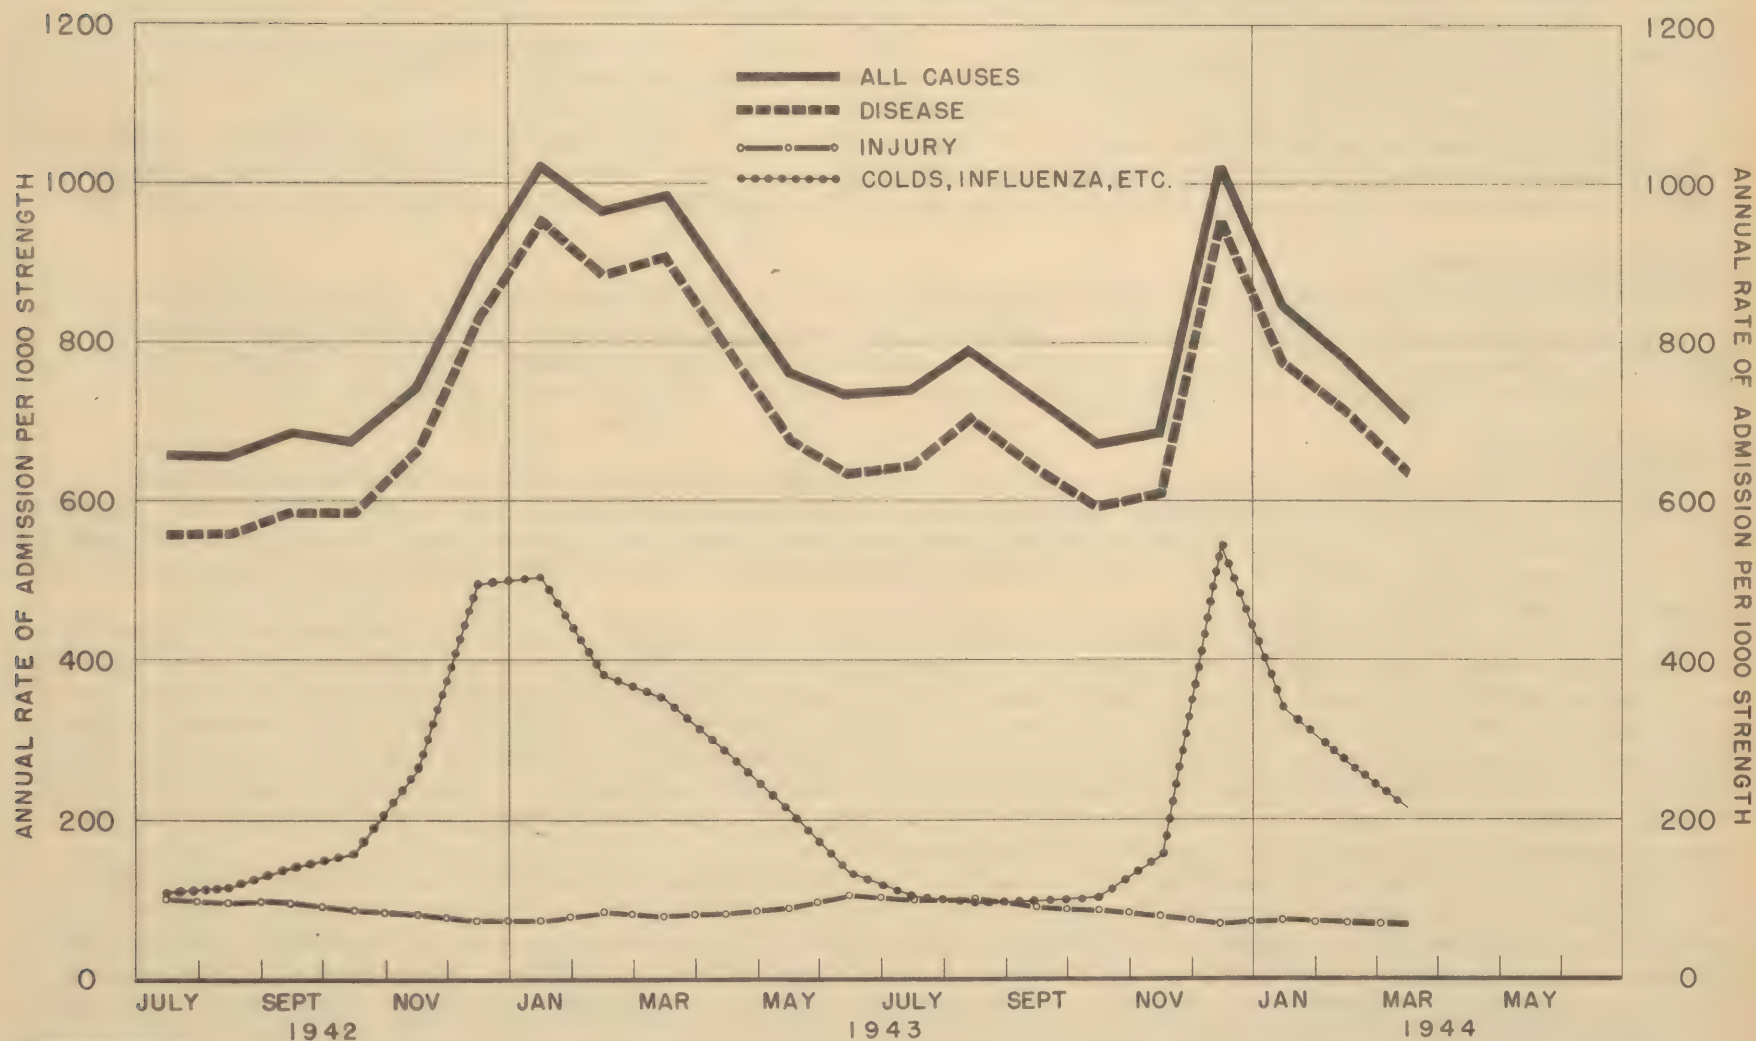

Admission rates from colds, influenza, etc. declined about 20 percent from 271 per thousand in February to 213 per thousand in March. This latter rate was about 40 percent below that for March 1943 and nearly 50 percent under the corresponding rate for March 1942. Morbidity from respiratory causes has followed much the same trend in 1944 as in 1943 but with rates about 140 per thousand lower. The admission rate for the first quarter of 1944 was about 35 percent lower than for 1943.

Lower morbidity from colds, influenza, etc. was registered in all Service Commands except the Sixth which reported no change in the admission rate. The largest decreases in morbidity from this cause were recorded in the Seventh Service Command (which however continued to experience a relatively high rate) and in the Military District of Washington; Both of these Commands registered decreases in the admission rate of more than 100 per thousand as between the two months. The Sixth Service Command reported the highest morbidity from colds, influenza, etc. (about 90 percent higher than for the country as a whole), while the lowest rate was again recorded by the Eighth Service Command (almost 30 percent under the rate for the entire United States).

Morbidity from all forms of pneumonia declined about 20 percent as compared with the previous month. The annual admission rate of 16.2 per thousand for March was about 35 percent lower than for the corresponding month

MORBIDITY FROM — ALL CAUSES — DISEASE — INJURY — COLDS, INFLUENZA, ETC.

CONTINENTAL UNITED STATES

RESTRICTED

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

of 1943, while the rate for the first quarter of 1944 was about 20 percent under 1943. The Sixth and Seventh Service Commands reported by far the highest morbidity from pneumonia having admission rates about twice as high as those for the country as a whole. The Sixth Service Command showed somewhat higher morbidity from pneumonia in March than in February, but the rate for the Seventh Service Command declined appreciably from the very high rate which prevailed there in February. The lowest admission rate from pneumonia was reported by the Eighth Service Command, with the Ninth Service Command also having a low rate.

Atypical pneumonia accounted for about 57 percent of the total pneumonia admissions, a somewhat higher percentage than during the preceding two months. The proportion of cases diagnosed as atypical pneumonia was highest in the First, Third, and Fourth Service Commands, for all of which this proportion was about 70 percent.

DIARRHEA AND DYSENTERY:

Admissions from diarrhea and dysentery decreased in March by about 30 percent as compared with February to the lowest rate since March 1943. The rate for March 1944 was nevertheless about 40 percent higher than for March 1943. The Second Service Command reported the highest admission rate from this cause (13 per thousand), while the lowest morbidity (3 per thousand) was again reported by the Sixth Service Command.

VENEREAL DISEASE:

Morbidity from venereal disease excluding EPTS cases increased slightly in March to 28.5 per thousand. This rate is relatively high as compared with those which prevailed during 1943 and is about 20 percent higher than for March 1943. The entire increase arises from gonorrhea since the current level for syphilis is about 10 percent under the average for 1943, while for all other venereal diseases morbidity has recently been about 30 percent lower than in 1943.

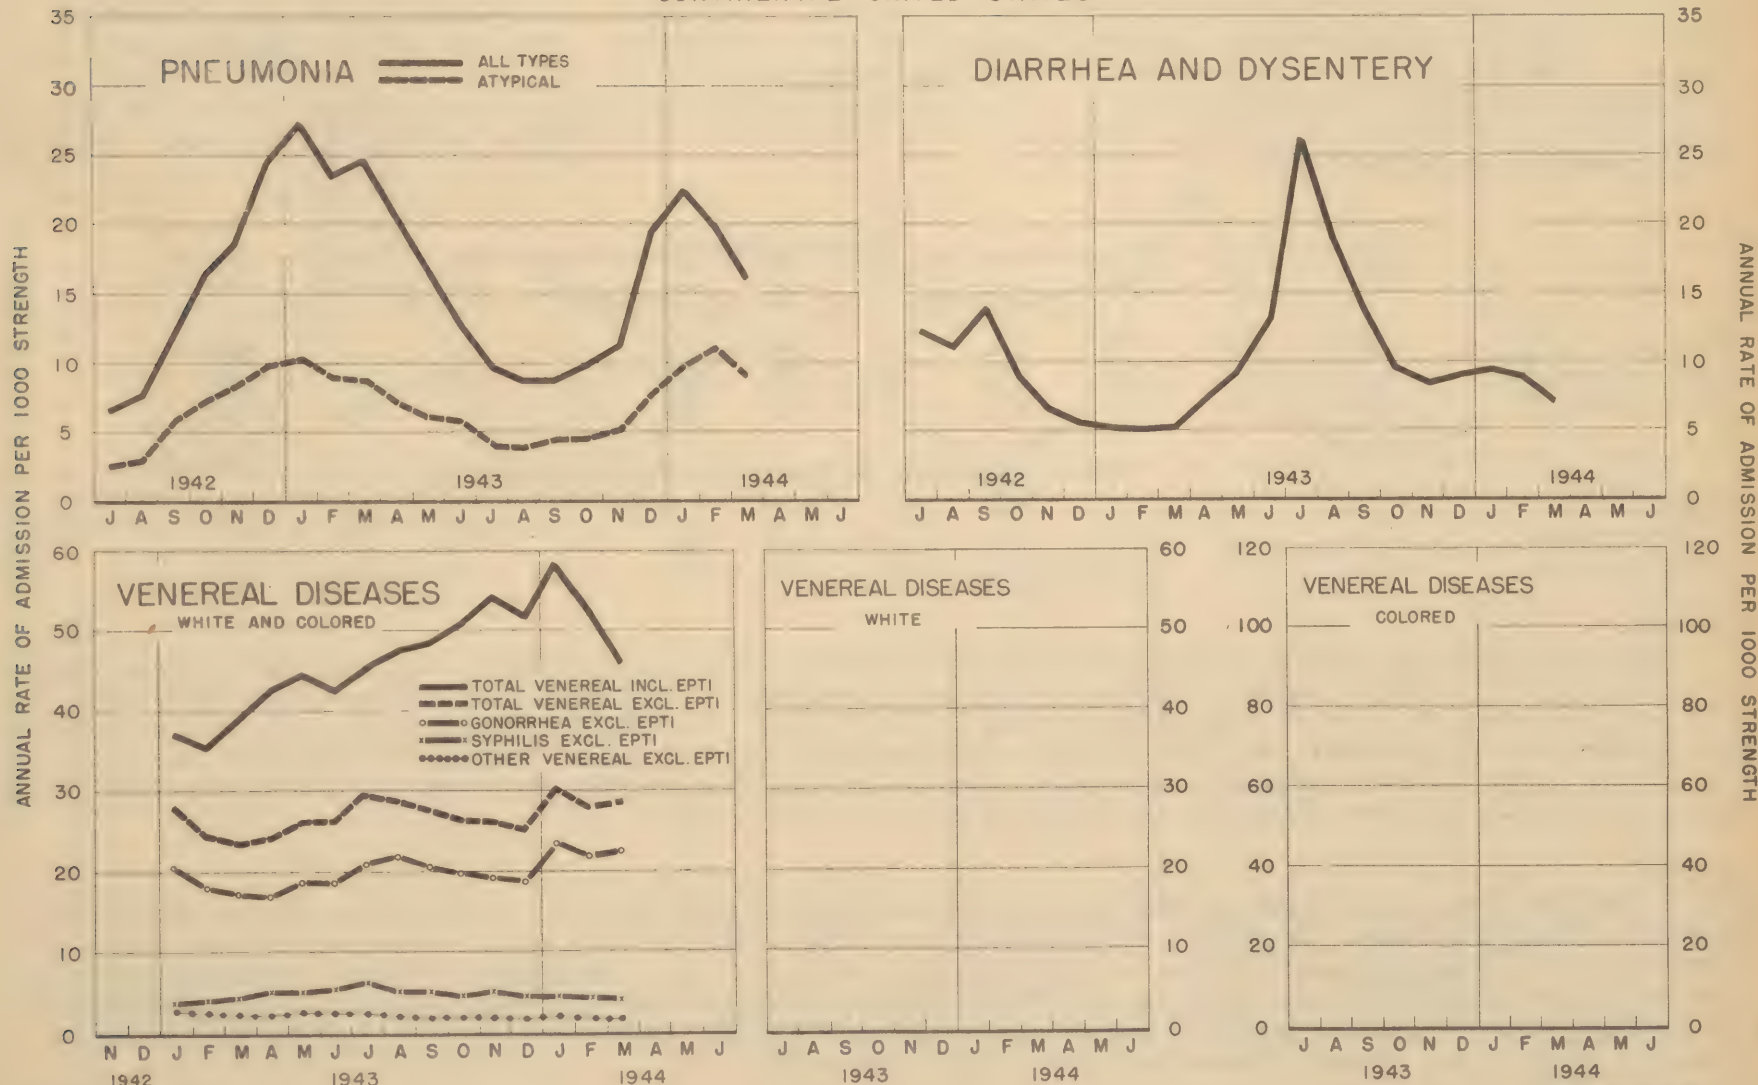

The Second and Fifth Service Commands continued to report the highest morbidity from venereal disease excluding EPTS cases, while the Military District of Washington and the First Service Command again experienced very low morbidity from these causes. The Second Service Command shows a high rate of admission because of high incidence among task force troops not under the jurisdiction of this Command. The Third Service Command experienced the highest morbidity from syphilis, while the Seventh Service Command had a relatively low rate. Both the Second and the Fourth Service Commands had relatively high morbidity from all other venereal diseases, whereas extremely low admission rates from these causes were recorded in the Third, Sixth, Seventh and Ninth Service Commands and the Military District of Washington.

Morbidity represented by venereal EPTS cases was reported at about 18 per year per thousand during March or a decline for the second consecutive month to the lowest level attained in the past 8 months; this reflects partially a decrease in the number of inductions. Variations in the admission rate for venereal EPTS cases as between Service Commands have little significance because they reflect a different geographical distribution of Army personnel as compared with that of new inductees, different proportions of white and colored selectees, and varying administrative practices.

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

The numbers of venereal disease (excluding EPTS) cases remaining under treatment in hospital at the end of the month are shown in the table below by Service Command. The numbers are related to the total number of patients remaining under treatment in hospital as of the end of the month. From the table it appears that .8 percent of the total patients in hospital are syphilis cases while 2.0 percent have other venereal diseases (including gonorrhea). The longer duration of hospitalization for syphilis is thus indicated by the fact that only about 15 percent of the venereal admissions are for this cause as contrasted with about 30 percent of the cases remaining under treatment.

MEASLES:

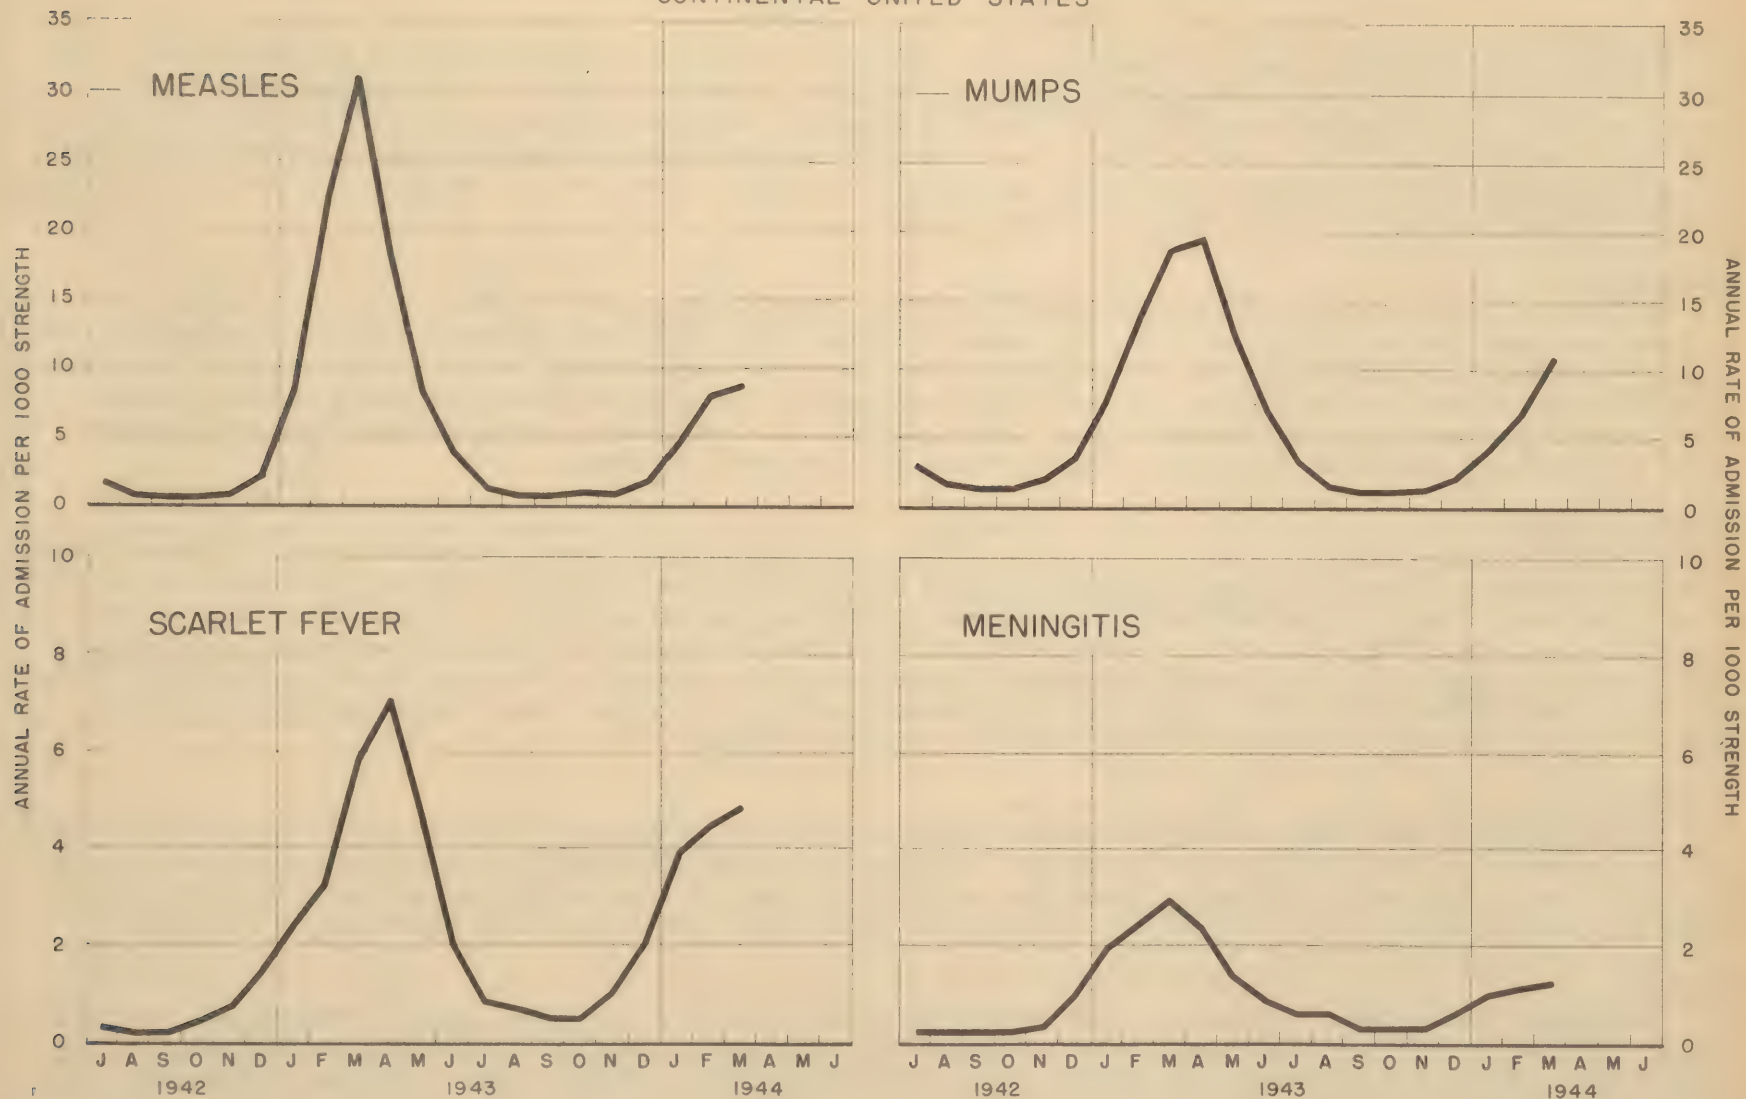

Morbidity from this cause continued to show the expected seasonal upward trend although the increase from February was only about 10 percent. The admission rate from measles for March 1944 was more than 70 percent under that for March 1943 and 60 percent lower than for March 1942. For the first quarter of 1944 measles morbidity was about 65 percent lower than for the corresponding period of 1943. The highest morbidity was again registered in the Seventh Service Command which nonetheless had a relatively low rate as compared with those prevailing during the peak months of the previous years.

MUMPS:

Morbidity from mumps increased sharply in March as compared with February, the relative change being somewhat more than 50 percent. Nevertheless, morbidity from this cause was only about 60 percent of that experienced during the corresponding months of 1942 and 1943, while for the first quarter of 1944 the mumps admission rate was about 50 percent under that for the first quarter of 1943. The Third and Seventh Service Commands had the highest admission rates, about 50 percent above the rate for the country as a whole; all Service Commands showed notably higher rates in March as compared with February.

MORBIDITY FROM — MEASLES—MUMPS SCARLET FEVER—MENINGITIS

CONTINENTAL UNITED STATES

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

SCARLET FEVER:

Morbidity from scarlet fever increased by only about 10 percent as compared with the previous month. The March 1944 admission rate was midway between the relatively high rate recorded in March 1943 and the low rate for March 1942. Admissions for scarlet fever were at about the same rate during the first quarters of 1943 and 1944 but substantially higher than in 1942. The Sixth and Seventh Service Commands again reported by far the highest morbidity from this cause, the former having a rate about 4 times as high as that for the United States as a whole, and the latter a rate about $2\frac{1}{2}$ times as high.

MENINGITIS:

Morbidity from meningitis increased slightly and for March was reported at about 1.2 per thousand. This is less than half the rate reported from this cause in March 1943, which was the peak month during the past two years. Likewise, the admission rate for meningitis for the first three months of 1944 was less than half that for the corresponding period of 1943. The highest incidence of meningitis was in the Third Service Command which reported a rate about 75 percent higher than that for the country as a whole during March and likewise about 75 percent higher than for that Service Command for the previous month.

RHEUMATIC FEVER:

Morbidity from rheumatic fever was reported at 2.2 per thousand for March, which was about 25 percent higher than in February. There has been a steady increase in morbidity from this cause during 1944 from the relatively low level (about .8 per thousand) which prevailed during the latter part of 1943. The admission rate for March 1944 was almost twice as high as that for March 1943, but nevertheless about 10 percent below the peak rate reached in May 1943. The largest increases in morbidity from rheumatic fever occurred in the Sixth, Third and Fifth Service Commands. The Seventh Service Command continued to report the highest morbidity from this cause (9.1 per thousand or slightly higher than the previous month).

TUBERCULOSIS:

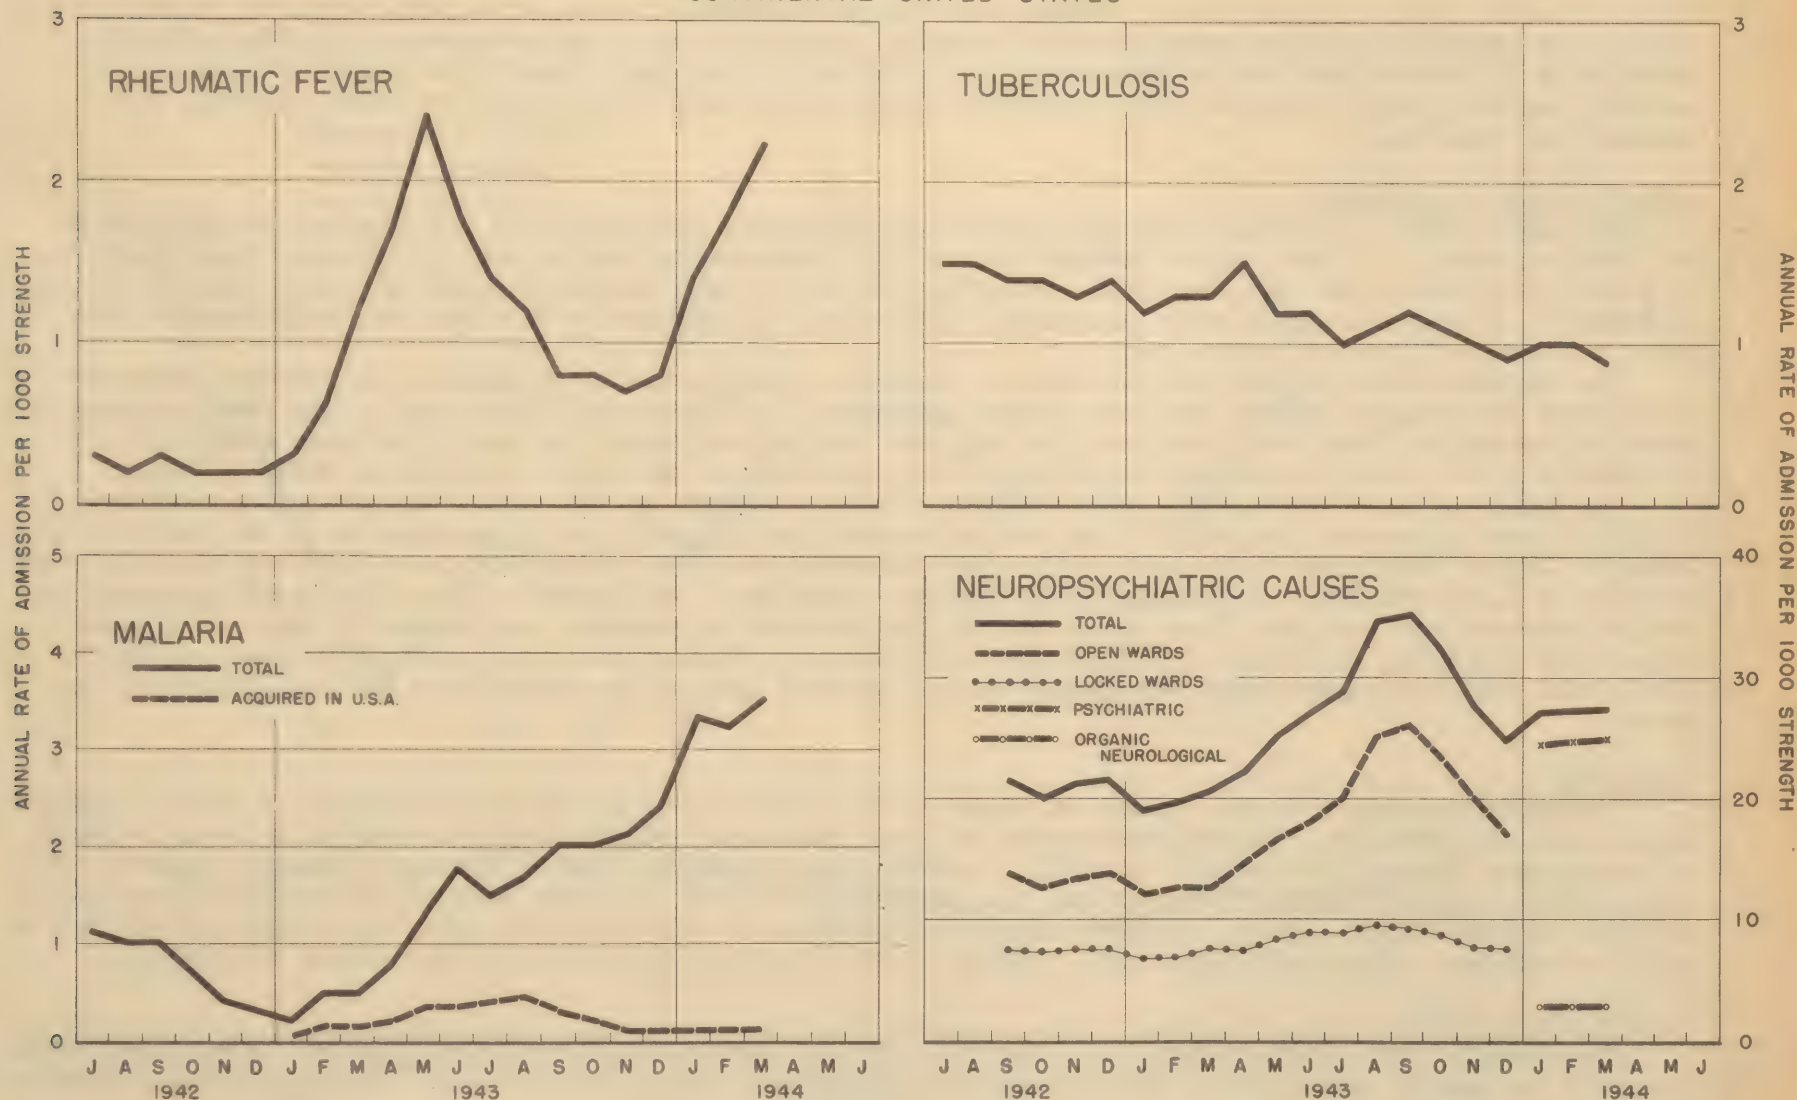

Morbidity from this cause showed a slightly lower rate for March than for the two previous months; at only .9 per thousand the admission rate for March was the same as for December 1943 which recorded the lowest rate thus far. As of the end of the month there were about 1100 cases of tuberculosis remaining under treatment; these represented about .7 percent of the total number of patients remaining under treatment in hospital.

MALARIA:

Morbidity from malaria acquired in the United States continued at a rate of .1 per thousand for the fifth consecutive month. On the other hand, malaria presumably acquired outside of the United States showed an admission rate of 3.5 per thousand, the highest so far recorded. The continued sharp increases during 1943 and 1944 in the admission rate from malaria acquired overseas reflect the increasing number of troops returning

MORBIDITY FROM — RHEUMATIC FEVER — TUBERCULOSIS MALARIA — NEUROPSYCHIATRIC CAUSES

CONTINENTAL UNITED STATES

RESTRICTED

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

to this country from malarious areas. Whereas the largest numbers of cases of malaria acquired in the United States have generally been reported from the Southern states those acquired overseas are fairly uniformly distributed as between the service commands. As of the end of the month there were about 1900 cases of malaria remaining under treatment which represent about 1.2 percent of the total patients remaining under treatment in hospital.

NEUROPSYCHIATRIC DISORDERS:

The annual rate of admission for neuropsychiatric disorders remained at 27 per thousand or the same as the previous month. In fact, since October the rate of admission has varied but little about this figure which is considerably below the high admission rates recorded during July through October 1943 when special efforts were made to detect neuropsychiatric disorders, particularly in connection with the reconsideration of the medical fitness of limited service men.

For the first time it has been possible to subdivide neuropsychiatric admissions as between psychiatric and organic neurological cases, with the former accounting for 90 percent of the total. The chart on page 41 shows the admission rates for psychiatric and organic neurological cases for the first three months of 1944, the rates for the first two months of the year being estimated on the basis of the March data.

The number of neuropsychiatric cases remaining under treatment at the end of the month decreased to 16,035 or about 5 percent less than at the end of February and almost exactly the same as at the end of January. Locked ward cases increased for the third consecutive month to number almost 5,000 or slightly below the peak of 5,100 attained in September 1943. On the other hand, the number of open ward cases remaining decreased somewhat and was lower than at the end of the previous two months. As related to the total number of patients remaining in hospital for all causes the neuropsychiatric cases represented 10.1 percent of the total, with the locked ward cases accounting for 3.1 percent and the open ward cases for the remaining 7.0 percent.

MORTALITY:

The mortality rate from all causes was reported at 2.50 per year per thousand strength or about 5 percent higher than for February. The reported mortality rate from injury was at about the same high level in March as during June through October 1943 but still somewhat below the peak rate of 2.06 per thousand reported for January 1944. Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated.

NON-EFFECTIVE RATE:

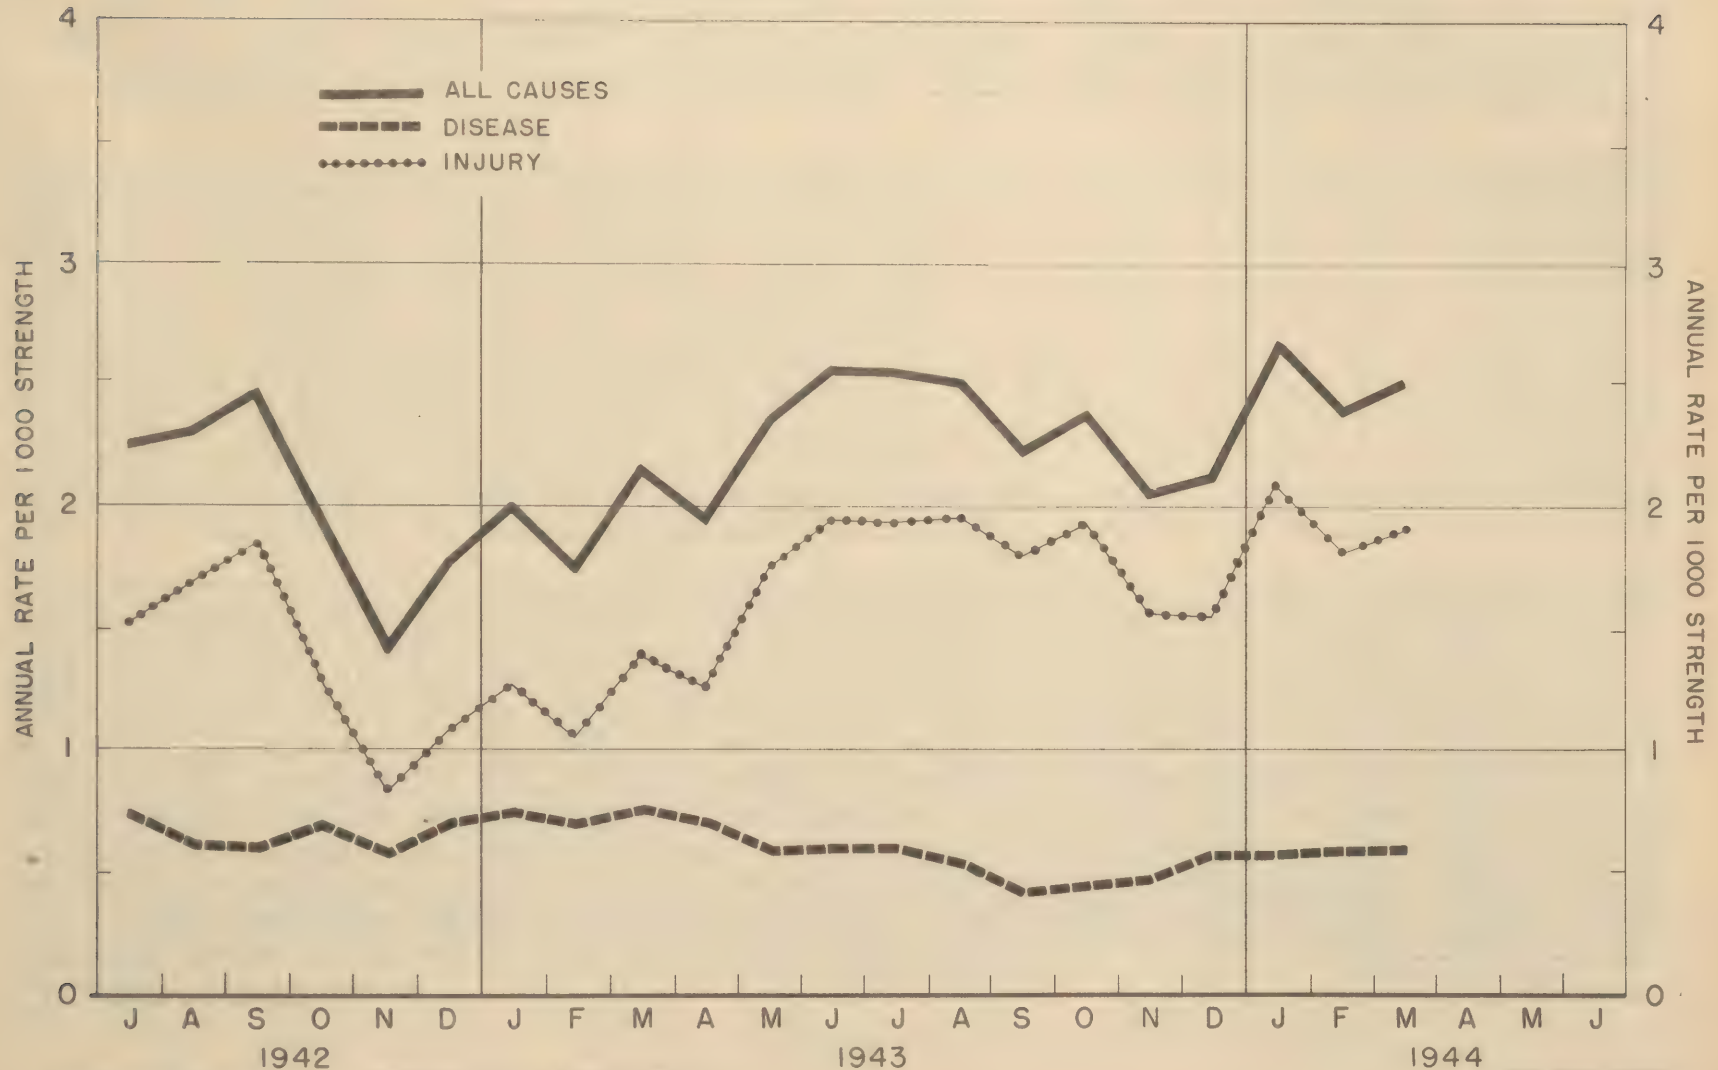

The non-effective rate for March 1944 was 38.4 per thousand strength or about 3 percent lower than during the first two months of the year. For March the non-effective rate from injury was 7.4 per thousand strength or about the same as that reported for both January and February 1943.
